The graph illustrates the projected increase in the aging population across different nations. Japan and Germany are highlighted with the steepest upward slopes, indicating rapid growth in their elderly populations. The United States and the United Kingdom show more moderate but steady increases. The Soviet Union and China are projected to have lower percentages of the population aged 65 and over by 2050, though still showing an upward trend.

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).

Figure 1: Schematic representation of the experimental design. The diagram shows a sequence of events: a subject is presented with a stimulus (a red dot), then a response is recorded (a green dot), and finally, the subject is presented with a stimulus (a red dot) again. The response is recorded (a green dot) again. The sequence is repeated for multiple trials. The diagram is labeled "Figure 1" and "Schematic representation of the experimental design".

85+	~2%

Figure 1. The structure of the proposed model.

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher than the number of incorrect responses for all groups. The number of correct responses was significantly higher than the number of incorrect responses for all groups. The number of correct responses was significantly higher than the number of incorrect responses for all groups.
