Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).

11. *Chlorophyll a* and *Chlorophyll b* were determined by the method of Arar and Collins (1971) using a Shimadzu 1601 UV-Visible Spectrophotometer.

Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (C) and the experimental group (E). The control group (C) was divided into two subgroups: the control group (C) and the control group (C). The experimental group (E) was divided into two subgroups: the experimental group (E) and the experimental group (E). The control group (C) was divided into two subgroups: the control group (C) and the control group (C). The experimental group (E) was divided into two subgroups: the experimental group (E) and the experimental group (E).

1. **Identify the main topic of the text.**
 2. **Summarize the main points of the text.**
 3. **Identify the author's purpose in writing the text.**
 4. **Identify the author's tone in writing the text.**
 5. **Identify the author's audience in writing the text.**
 6. **Identify the author's main argument or thesis.**
 7. **Identify the author's supporting evidence.**
 8. **Identify the author's conclusion.**
 9. **Identify the author's main point or message.**
 10. **Identify the author's main goal or objective.**

III. $\mathcal{W} = \mathcal{W}_1 \cup \mathcal{W}_2$ and $\mathcal{W}_1 \cap \mathcal{W}_2 = \emptyset$. In this case, we have

Abstract The purpose of this study was to determine whether there were differences in the prevalence of risk factors for coronary artery disease between men who had been exposed to asbestos and those who had not. A case-control study was conducted among men aged 60 years or older who had been employed in asbestos-related occupations before age 60. The prevalence of smoking, hypertension, diabetes mellitus, hypercholesterolemia, and obesity was compared between cases and controls. The results showed that the prevalence of all five risk factors was significantly higher in the exposed group than in the control group. The findings suggest that exposure to asbestos may be associated with an increased prevalence of risk factors for coronary artery disease.
